

Eccentric Screw Pumps

Series AE.N Design RG

Application

For pumping highly viscous to no more flowable, neutral or aggressive, uncontaminated or abrasive liquids as well as products containing gases also with fibrous and solid material. Here, the screw shafts can additionally serve as mixing device.

Main fields of application

Waste water and waste water treatment engineering, the chemical and petro-chemical industries, the paper and cellulose industries, the soap and fats industry, the paint industry, the food and beverage industry, the plastics industry, ceramics, agriculture, the sugar industry etc.

Operation

Rotary self-priming positive displacement pump the pumping elements of which are the rotating eccentric screw (rotor), the fixed stator and the feeding screws.

In any cross sectional plane, rotor and stator are in contact with one another at two points, and along the length of the pumping elements these points form two lines of seal. The material contained in the sealed enclosed cavities which are formed as the rotor turns is displaced axially and with complete continuity from the suction to the delivery end of the pump. Despite the fact that the rotor rotates, no turbulence is produced. The constant volume of the enclosed cavities means that there are no pressurizing forces and thus guarantees a low-surge pumping action which is not at all severe on the material being pumped.

Design features

The outlet section, stator and suction casing are held together by external connecting screws (tie rods).

In case of all sizes, the suction casing has a feeding hopper the vertical wall surfaces of which prevent deposits of the material to be conveyed. The rectangular connecting flange is provided for the attachment of filling hoppers.

The particularly large engaging feeding or mixing screws are dimensioned so that an optimum mixing effect and a reliable filling of the conveying elements via the particularly long stuffing box housing is effected.

The stator which is vulcanized into a tube or jacket casing (uniform elastomer wall thickness) is provided at both ends with external collars vulcanized to it which provide a safe seal from the suction casing and outlet section and also protect the stator casing against corrosion.

The drive shaft is carried in bearings in the bearing housing. The drive torque is transmitted to the rotor via the drive shaft, pump shaft and joint shaft and, via a tooth gear step, to the screw shaft. The joint shaft terminates at both ends in pin-type universal joints which are encapsulated to form a liquid-tight seal. These pin-type universal joints are of particularly simple and rugged design and are able to withstand the eccentric movement of the rotor without any difficulty.

Shaft seals

The shaft seals consist of packing glands on the drive side and a running gear seal on the stator side.

Bearings

The shafts are secured in sturdy and maintenance-free bearings. The bearings are lifetime-lubricated deep groove ball bearings.

Technical characteristics

The output, permitted speed range and drive power required can be taken from the selection chart on page 3 or from the separate individual pump characteristics.

		single-stage	two-stage	four-stage
Flow rate	Q l/min up to	500		
Temperature of liquid pumped	t °C ① up to	150		
Differential pressure	single-stage	6 ②	-	-
	two-stage		12 ③	-
	four-stage		-	16(20 ⑥)
Pump discharge pressure	p _d bar up to	16 (25 ⑥)		
Suction obtainable	p _s bar up to	0.5 ④		
Viscosity	η mPa s up to	1,000,000 ④		
Permissible solids content	% by vol. up to	95 ⑤		
Permissible casing pressure, suction casing	p _z bar up to	0.5		
Dry substance content	% ④ up to	45		

The mentioned performance data are to be considered as a product and performance abstract only. The particular operating limits can be taken from the quotation or order acknowledgement.

Max. permissible grain sizes and fibre lengths

Pump size	100	200	380	750	1450	2700
max. grain size mm	3.8	5	6.8	9.5	14	20
max. fibre length mm	48	60	79	98	130	210

Increases in solid content and grain size mean that the speed of the pump must be reduced.

- ① Depending on the liquid pumped and the elastomers used.
- ② 12 bar for stator with uniform elastomer wall thickness.
- ③ 16 (20 ⑥) bar for stator with uniform elastomer wall thickness.
- ④ Depending on liquid pumped, speed and pump size.
- ⑤ Depending on pump size as well as kind and size of solids.
- ⑥ Possible for sizes 380, 750, 1450, 2700.

Exchangeability of components

The components of all eccentric screw pumps are manufactured according to a modular construction. Thus, even when using pumps of various series and types in one plant, a simple and budget-priced spare parts stocking is assured.

Drivers

For possible types of drive see page 10.

Drivers produced by any manufacturer can be used. Technical characteristics and dimensions should be taken from the documentation issued by the manufacturers.

Installation

AE.N...-RG pumps are installed horizontally.

The pump and driver are connected together via a flexible coupling and are mounted on a common base plate. Dimensions of assemblies available on request.

Performance chart

To give a rough indication of the appropriate pump size and speed as a function of the required output and the nature of the liquid to be pumped. $v_{g,m}$ = mean rubbing speed of rotor in stator.

* Largely depending on the fluid to be pumped. Please inquire.

Information on performance ranges not covered by the AE.N...-RG series can be found on the back cover of this brochure or in the separate brochures dealing with the other series. For exact performance data, see the individual pump characteristics.

Type coding

Explanatory notes on the type coding:

Position in type coding	Designation	Design						
①	Product	ALLWEILER eccentric screw pump						
②	Number of stages	1 = single-stage up to Δp 6 bar (Δp 12 bar for stator with uniform elastomer wall thickness), 2 = two-stage up to Δp 12 bar (Δp 16 (20) bar for stator with uniform elastomer wall thickness), 2+2; 4 = 2+2 stage; four-stage up to Δp 16 (20) bar						
③	Mechanical execution	N = rated for Δp 16 (20) bar						
④	Size	Possible sizes: 100, 200, 380, 750, 1450, 2700 The numbers indicate the theoretic flow rate in l/min with $n = 400$ 1/min and $\Delta p = 0$ bar						
⑤	Design	RG = Snap type with internal gear bearing						
⑥	Bearing design	3 = hose-proof, bearing with rotary shaft seal or sealing cap. All bearings lifetime-lubricated.						
⑦	Type of inlet/outlet connections	Suction casing connection according to dimensional drawing, page 9 Type of outlet connection 1 = DIN flanges 3 = ANSI flanges X = Special-type suction casing connection and/or outlet connection] according to dimensional drawing, page 9						
⑧	Branch position	1 - For the position, please see drawing on page 9						
⑨	Design of shaft seal	L = Packing glands on drive side and a running gear seal on stator side						
⑩	Type of shaft	0 = Shaft hard-chrome-plated in the packing region without shaft wear sleeve						
⑪	Type of shaft seal	Stuffing boxes 1 = Stuffing box of standard design (without lantern ring/without flushing ring)						
⑫	Design options	<table border="0"> <tr> <td>Stators with non-uniform elastomer wall thickness (all elastomers)</td> <td>Stators with uniform elastomer wall thickness (all elastomers)</td> </tr> <tr> <td>N M H T] Thermal expansion clearance as a function of the temperature of the fluid pumped</td> <td>D E F R] Thermal expansion clearance as a function of the temperature of the fluid pumped</td> </tr> <tr> <td>C = Rotor hard-chrome plated Y = Rotor ductile hard-chrome plated Z = Rotor spray metal-coated</td> <td>B = Stator adjustable G = Stator with uniform elastomer wall thickness Q = Mixing screws X = Other designs</td> </tr> </table>	Stators with non-uniform elastomer wall thickness (all elastomers)	Stators with uniform elastomer wall thickness (all elastomers)	N M H T] Thermal expansion clearance as a function of the temperature of the fluid pumped	D E F R] Thermal expansion clearance as a function of the temperature of the fluid pumped	C = Rotor hard-chrome plated Y = Rotor ductile hard-chrome plated Z = Rotor spray metal-coated	B = Stator adjustable G = Stator with uniform elastomer wall thickness Q = Mixing screws X = Other designs

Driving possibilities

2 AE.N...-RG with flexible coupling and geared motor

3 AE.N...-RG with flexible coupling and internal combustion engine

6 AE.N...-RG with flexible coupling and infinitely variable speed drive

7 AE.N...-RG with flexible coupling, gear box or variable speed gear, flexible coupling and motor

Further drive options (e.g. hydraulic or pneumatic drives) are possible.

Accessories

Pump accessories: Stator setting devices, electrical heaters, bridge breakers.

Drivers: Electric motors, geared motors, variable speed transmissions, reduction gearboxes, internal combustion engines, pneumatic and hydraulic drives.

Transmission components: Couplings, V-belt transmissions, toothed belt transmissions, other types of transmission.

Base plates: Standard and special versions, wheeled trolleys, mounting flanges.

Safety arrangements: Bypass lines with safety or regulating valves, systems to guard against dry running (conductive, capacitive, thermal etc.).

Other accessories: Electrical, hydraulic and pneumatic control arrangements, filter systems, metering equipment, seal liquid and circulating systems for shaft seals, valves, flanges, flexible pipes.

Subject to technical alterations.
